

EVERY DEVICE, EMPLOYEE, AND LOCATION IS COVERED WITH
SECURE ACCESS SERVICE EDGE (SASE)

YOUR SECURITY SHOULD WORK WHEREVER YOUR TEAM DOES.

Security used to have a simple solution. When everyone worked in one place on one network, a single layer of protection was usually enough. Most businesses don't operate that way anymore. Kaco helps Alberta businesses close the subtle gaps that open up when your people connect from home offices, client sites, and multiple locations at once with cloud-delivered network security that works wherever your team does.

Every location, device, and application your team connects through is a potential entry point into your business.

THE GAPS ARE HARDER TO SEE THAN YOU THINK

When each person is logging in from a different site, you get **inconsistent security and levels of protection** across each one.

The risks usually don't become obvious until a problem surfaces.

THE OLD TOOLS WEREN'T BUILT FOR THIS

Most businesses end up with a complicated security setup that developed by accident. It starts with a VPN for remote access, then another tool gets layered on to cover a gap, then another. Over time, **you end up managing several disconnected systems that weren't designed to work together.** Getting a clear picture of what's actually happening across your environment becomes increasingly difficult. Every time your business adds a person, a location, or a new application, the tangle gets worse.

KACOSYSTEMS.CA

A SINGLE SYSTEM THAT WORKS FOR YOUR WHOLE BUSINESS

There's a cleaner way to approach this. Rather than patching gaps as they appear, Kaco helps you build **a single network security foundation that covers every user, device, and application from the start** and holds your business up as it changes. Your team gets consistent protection no matter where they're working from or what they're connecting to, without you having to manage the technology behind it or think about how it fits together.

HOW WE DO IT

SECURE ACCESS FROM ANYWHERE

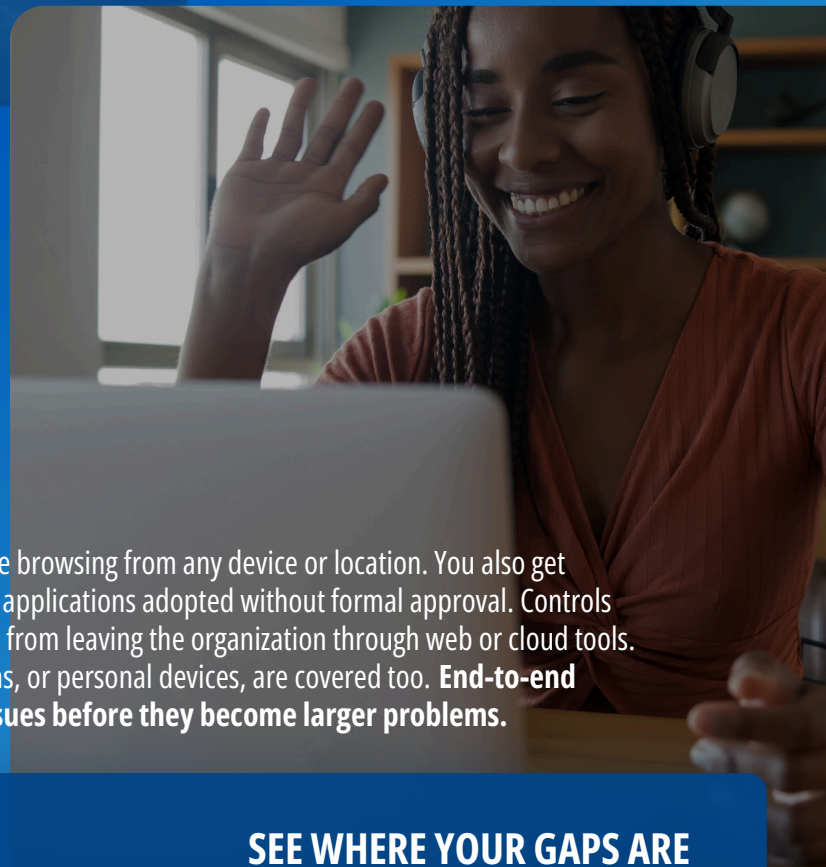

Instead of implementing VPN-based access, Kaco uses one consistent, secure system with an always-on approach that continuously verifies identity, even after logging in, regardless of where someone is working. Remote workers, branch offices, and locations without on-site IT support like a retail site or warehouse are all protected under the same setup. It covers every application your team uses, from internal company systems to cloud tools and third-party software. Built-in monitoring gives you visibility into application performance across your environment, so slowdowns and issues are caught before they affect your team's day.

CONTROL OVER WHO ACCESSES WHAT

- Verify every user + device
- Continuously validate access (not just at login).
- Grant permissions based on role + need
- Automatically restrict non-compliant devices
- Record sensitive sessions for auditing

PROTECTION ACROSS THE WEB, CLOUD, AND EVERY DEVICE

Your people are protected from malware and data theft while browsing from any device or location. You also get **visibility into how cloud tools are being used**, including applications adopted without formal approval. Controls over platforms like Microsoft 365 help prevent sensitive data from leaving the organization through web or cloud tools. Devices that can't run security software, like printers, cameras, or personal devices, are covered too. **End-to-end monitoring helps surface performance and security issues before they become larger problems.**

SEE WHERE YOUR GAPS ARE

Connect with Kaco to get a free network assessment and talk about where your setup has gaps and what a cleaner approach could look like.
